

Set the operating question

Replacement video: about 137.5 seconds. Read narration without labels.

Current video: [YouTube replacement](#)

AI voice: en-IN-PrabhatNeural, rate -3%. Wording simplifies jargon and spells selected acronyms for speech. Playback is verified. Studio English subtitle publication is complete; watch-page CC is not yet verified. No human listening review or perfect pronunciation is claimed.

Scene 1 / The question

SCREEN ACTION - do not say: Show product heading and readiness summary.

Hi, I'm Shivam Gupta. This is Runway Guard. Can your crypto treasury still pay your team?

A portfolio balance tells you what your assets are worth today. It does not tell you whether the next payroll payment is covered if prices fall, or funds become inaccessible.

Scene 2 / The fictional sample

SCREEN ACTION - do not say: Show holdings, cash, costs and existing payroll. Avoid adding a duplicate.

Here is a fictional sample team. It has crypto holdings, twenty five thousand dollars in cash, and forty two thousand dollars in monthly operating costs.

You can enter balances manually, or import a C S V file. Then schedule payroll and add individual expenses.

Sample inputs: ETH 80, SOL 500, USDC 80,000, USDT 30,000 and BTC 0.5 locked. Fiat \$25,000. Monthly costs \$42,000 include \$30,000 payroll due in seven days. Infrastructure renewal \$20,000 is additional.

Show data and the scenario

Let the actual response and chart finish updating.

Scene 3 / The real call

SCREEN ACTION - do not say: Refresh and inspect authenticated source evidence.

Refresh fetches real Coin Market Cap prices. The evidence view shows the response and timestamps behind the calculation.

Scene 4 / The stress

SCREEN ACTION - do not say: Show 40% volatile drawdown, 10% USD Coin drop and coverage.

Now let's assume a forty percent decline in volatile assets, and a ten percent drop in U S D Coin. These are assumptions, not predictions.

The chart compares current and stressed coverage as expenses come due. Locked assets cannot fund those expenses.

Scene 5 / Timing and access

SCREEN ACTION - do not say: Show existing recurring payroll. Freeze USD Coin, inspect exclusion, then clear it.

A recurring payroll row schedules its share of monthly costs. The app does not count that expense twice.

You can also simulate losing access to an asset, and see how the available funds change.

The integrated endpoint is `/v3/cryptocurrency/quotes/latest`. An existing participant-owned key returned HTTP 200 with five assets. Earlier keyless evidence remains fallback history. Basic account. Campaign Startup grant is unverified.

[CMC quote reference](#)

Preserve the decision

Current narration uses plain terms for the reserve estimate and report.

Scene 6 / Reserve planning

SCREEN ACTION - do not say: Show reserve estimate, asset units and assumptions. No execution.

The reserve preview estimates how much cash we need for our chosen reserve period. It shows which available volatile holdings could fill the gap under these assumptions.

This is a planning estimate. The app does not execute trades. Reported market volume does not guarantee sale proceeds.

Scene 7 / A preserved report

SCREEN ACTION - do not say: Show preserved record, JSON export or print view.

A saved report preserves the inputs, prices, and assumptions. Someone else can review the result after prices change.

Scene 8 / The next step

SCREEN ACTION - do not say: Return to summary. Hold after the final question.

We are starting with a focused problem for small teams funded by crypto. The next step is to validate a weekly planning workflow with those teams, then add paid reviews and alerts.

Runway Guard connects a changing market to a concrete question. Can we cover the obligations coming due?

Trust boundary: Browser calculations preserve user inputs and market observations. Firestore rules enforce ownership and immutability, but do not attest financial accuracy.

Publication: Replacement [YouTube video](#) is public. Playback is verified. The English SRT is published in Studio; watch-page CC is not yet verified. Burned captions are present, with 33 timed cues. DoraHacks BUIDL 49254 remains submitted under review. Corrected X reply: <https://x.com/ShivamGuptaim/status/2105282566807015714>.
