

Set the operating question

Target: about 2 minutes. Read narration only, without numbered labels.

Live demo: runway-guard-cmc.web.app

Refresh quotes and use the fictional sample. Keep private account details and secrets off screen. Google sign-in and live CMC refresh are verified. Verify save and report actions in the recording session before filming them.

00:00-00:19 / The question

SCREEN ACTION - do not say: Show the product heading and readiness summary.

Hi, I'm Shivam Gupta. This is Runway Guard, a tool that asks whether your crypto treasury can still pay your team.

A portfolio balance tells you what your assets are worth today. It does not tell you whether the next payroll payment is covered if prices fall or funds become inaccessible.

00:19-00:43 / The fictional sample

SCREEN ACTION - do not say: Show holdings, cash, burn and the existing payroll row. Avoid adding a duplicate.

Here is a fictional sample team. It has crypto holdings, twenty-five thousand dollars in fiat cash, and forty-two thousand dollars in monthly operating costs.

I can enter balances manually or import a CSV, then schedule payroll and add one-off expenses.

Sample inputs: ETH 80, SOL 500, USDC 80,000, USDT 30,000 and BTC 0.5 locked. Fiat \$25,000. Monthly burn \$42,000 includes \$30,000 payroll due in seven days. Infrastructure renewal \$20,000 is additional, due in fourteen days.

Show data and the scenario

Capture the actual response, then let the chart finish updating.

00:43-00:53 / The real call

SCREEN ACTION - do not say: Refresh and inspect endpoint, response and timestamps.

Refreshing fetches real CoinMarketCap quotes. The evidence view shows the response and timestamps behind the calculation.

00:53-01:13 / The stress

SCREEN ACTION - do not say: Show 40% volatile drawdown, 10% USDC depeg and the coverage chart.

Now I apply a forty percent decline to volatile assets and a ten percent USDC depeg. These are assumptions, not predictions.

The chart compares current and stressed coverage as expenses come due. Locked assets cannot fund those expenses.

01:13-01:31 / Timing and access

SCREEN ACTION - do not say: Show existing recurring payroll. Freeze USDC, inspect the exclusion, then clear the freeze.

A recurring payroll row schedules its share of monthly burn. The app does not count that expense twice.

I can also simulate losing access to an asset and see how the available funds change.

The integrated endpoint is `/v3/cryptocurrency/quotes/latest`, using real keyless access. Campaign-key evidence remains unavailable. Do not describe a cached response as a newly completed call. [CMC quote reference](#)

Preserve the decision

Use the working report flow and close with the next validation step.

01:31-01:53 / Reserve planning

SCREEN ACTION - do not say: Show reserve estimate, asset units and assumptions. No transaction execution.

The reserve what-if estimates how much fiat we need for our chosen reserve period, and which available volatile holdings could fill the gap under these assumptions.

This is a planning estimate. The app does not execute trades, and reported market volume does not guarantee sale proceeds.

01:53-02:04 / A preserved report

SCREEN ACTION - do not say: Show a previously generated report, JSON export or print view.

A saved report preserves the inputs, quotes and assumptions so someone else can review the result after prices change.

02:04-02:26 / The next step

SCREEN ACTION - do not say: Return to the summary. Hold for two seconds after the final sentence.

The commercial hypothesis is a focused tool for small crypto-native teams. The next step is to validate a weekly planning workflow with those teams, then add paid reviews and alerts.

Runway Guard connects a changing market to a concrete question: can we cover the obligations coming due?

Report boundary: Firebase calculates reports locally. Firestore rules enforce owner access and prevent later report changes, but do not independently certify financial calculations.

After filming: Upload the real video, add its URL to DoraHacks and the X draft, and include #BuildwithCMC. [Official requirements](#)
