

Set the question

Target: about 3 minutes. Read narration verbatim; do not read screen actions.

Before recording: Verify the deployed app, refresh quotes and load fictional Northstar Labs. Sample: ETH 80; SOL 500; USDC 80,000; USDT 30,000; BTC 0.5 locked. Fiat \$25,000; burn \$42,000; existing monthly payroll \$30,000 due in seven days; one-off infrastructure \$20,000 due in fourteen days. Use readable zoom and keep personal details and secrets off screen.

00:00-00:17 / The operating question

SCREEN ACTION - do not say: Show product header and sample coverage summary.

Hi, I'm Shivam Gupta, and this is Runway Guard. It answers one question: can your crypto treasury still pay your team?

00:17-00:36 / Why balances are not enough

SCREEN ACTION - do not say: Hold on current and stressed summary; move slowly.

A balance can look healthy while the money needed for payroll is exposed to token prices, a stablecoin depeg, or an asset you cannot access. Runway Guard connects market data to the obligations that actually matter.

00:36-01:00 / Meet the sample team

SCREEN ACTION - do not say: Show holdings, locked BTC, fiat, monthly burn and infrastructure obligation.

Here is our fictional sample team, Northstar Labs. It holds ETH, SOL, USDC and USDT, plus half a Bitcoin that is locked. There is twenty-five thousand dollars in fiat cash, forty-two thousand dollars in monthly operating costs, and an infrastructure renewal due in two weeks. These are editable sample inputs, not a real customer's finances.

Delivery: speak calmly, pause after the opening question, and avoid reading live totals that may change. The timing bands are guides, not a requirement to rush.

Show the evidence and stress

Use actual controls and let the result finish updating before moving on.

01:00-01:20 / A real CMC call

SCREEN ACTION - do not say: Click Refresh. Open evidence; show endpoint, timestamps and readable response. Never reveal a key.

I can enter balances or import a CSV. Refreshing makes a real CoinMarketCap call for all five assets. The evidence view shows the endpoint, response and timestamps, so you can inspect the data behind the numbers.

01:20-01:44 / Make assumptions visible

SCREEN ACTION - do not say: Show 40% volatile decline, 10% USDC depeg and the 90-day daily coverage chart.

Now let's stress the treasury. I'm applying a forty percent decline to volatile assets and a ten percent depeg to USDC. These are assumptions, not predictions. The chart compares current coverage with stressed coverage as obligations become due. The locked Bitcoin contributes to marked treasury value, but it cannot pay a bill.

01:44-02:09 / Payroll is a date

SCREEN ACTION - do not say: Show the existing \$30,000 recurring payroll row due in seven days. Do not add a duplicate. Apply a USDC access freeze, show warnings, then clear it.

Payroll timing matters too. A recurring payroll row schedules its share of the monthly burn; the app does not count that expense twice. One-off obligations are additional. If I simulate losing access to USDC, its available value is excluded from the stressed case. You can see how that changes coverage and the warnings.

If the API is temporarily unavailable, wait for recovery or record a truthful error-handling segment. Do not present cached evidence as a newly completed call. [CMC V3 quote reference](#)

Close with a reviewable decision

Finish the working flow, then state exactly what has and has not been completed.

02:09-02:34 / Reserve what-if

SCREEN ACTION - do not say: Show 3-month reserve, \$146,000 target, \$121,000 gap, estimated units and assumptions. Preview only; no trade.

The reserve what-if asks how much fiat would cover our chosen reserve period. It shows a gap and a deterministic estimate of available volatile assets needed to fill it, using stressed prices and our fee assumption. It does not execute a trade. CoinMarketCap's reported volume is context, not a promise that we can sell at this price.

02:34-02:54 / Preserve the decision

SCREEN ACTION - do not say: Use a signed-in personal workspace. Save, create a report, show JSON download and print view. Verify this flow before filming.

I can sign in with ChatGPT, save my own workspace, and preserve a report with the inputs, market snapshot, scenario and assumptions. The report exports as JSON or a clean printable document. That makes the result reviewable after prices change.

02:54-03:24 / Business and honest closing

SCREEN ACTION - do not say: Return to summary; hold for two seconds after the last sentence.

The business hypothesis is a focused tool for small crypto-native teams and their finance operators. There is no claimed customer traction or paid billing yet. The working product is the readiness workflow you just saw.

This build uses real keyless CoinMarketCap data today. Campaign-key evidence and registration still need completion before the final hackathon submission. Runway Guard turns market prices into a concrete operating question: are the next obligations covered, and what assumptions does that answer depend on?

Final update only after verification: Replace the two campaign-status sentences with: "This build uses CoinMarketCap quotes, and the submission includes an authenticated call made with my participant API key."
After filming: Upload the video, add its real URL to DoraHacks and the X draft, and include #BuildwithCMC. [Official submission requirements](#)
